Supplementary Figure 1

Immunohistochemical staining of normal tissues.
1-4 with antibodies to the A isoforms of NRG4. Note, staining patterns are different in the same tissues using different antibodies. e.g. in the kidney anti-123 stains proximal tubules (p) while anti-127 detects distal tubules (d). For full description see below.
5-7 different tissues stained with anti-134 (NRG4B3) showing variable (weak-5, moderate-6 and strong-7) endothelial cell (arrows) expression. Original magnification x63.
