

Supplementary Fig.5. Colony forming assay of 293 cells stably expressing wild-type (P) or the mutant versions of HIF2A at codon 531 (A is the positive control, S, L and T were identified in pheochromocytomas or paragangliomas). HEK293 (3,000 cells per plate, in duplicate) were plated in soft agar plates. Colonies were counted after 2 weeks. These experiments were repeated four times (p value not significant).
