

Supplementary Figure 7 Detailed gene expression timecourse analysis supports an AR-ERG-HES1-HES6 transcriptional cascade. (A-B) Androgen stimulation time-course gene expression profiles from VCaP (ERG-positive) and LNCaP (ERG-negative) prostate cancer cells. Panels on the left show the time-zero centred transcriptional profiles (log<sub>2</sub> ratios), panels in the center show mean-centered transcript profiles (with s.e.m.) and panels on the right show bar plots of the mean expression levels (log<sub>2</sub> intensity) for (A) ERG and (B) HES5. Data points are colour coded by condition and colour codes are consistent across all plots.
