Suppl. Fig. 1. Mouse serum thyroid hormone concentrations. MMI/perchlorate-treated mice were rendered eu- (20 ng/g body weight T4), hyper- (100 ng/g body weight T4) or hypothyroid (saline) by daily i.p. injections. Total T4 (TT4) levels were measured in serum after sacrifice. TT4 levels of untreated euthyroid mice served as control (two-tailed Student’s t-test: ***p<0.001; ns: not significant).
